

AT-140

Automatic Antenna Tuner

The AT-140 comes ready for simple antenna cable and power connections. When connected to the IC-M802, the AT-140 automatically bypasses tuning to improve frequency reception. Designed specifically for e-mail and shortwave listening, the AT-140 allows use of the entire antenna for best reception. Get fast frequency access without missing communication opportunities!

The AT-140 is housed in a durable, completely weather-resistant acrylic case with rubber gaskets. Install the unit near the antenna element base. While an ideal companion for the IC-M802 SSB, the AT-140 also works well with other Icom marine SSBs like the IC-M710 and the IC-M700PRO.

No adjustments are necessary - just connect the SSB control cable and antenna wire and go! The AT-140 automatically stores the matching conditions for up to 45 frequencies. Re-tuning to a memorized frequency takes about 1 second! Tune up in less than 3 seconds on any marine HF band! The AT-140 emits very little output power (just 300mW) during the tuning process, reducing the possibility of interference with other stations.
